

# Brain Injury Acute Inpatient Rehabilitation

## 2020 Outcome Summary

*Rebuilding lives, renewing hope.*

Brain injuries are frightening for patients and family members who don't know what to expect from the recovery process or how long it will take. UnityPoint Health® - Finley Hospital Acute Rehabilitation understands these overwhelming feelings. We work hard to address and answer the difficult questions that arise.

Each patient receives an individualized plan of care. Services are provided in a variety of settings, depending on the severity of the injury and stage of recovery. The goal for each individual is to help him/her achieve the best possible quality of life.

In 2020, we cared for 23 individuals with brain injuries, which included residents from Iowa and surrounding states. Patients had experienced either a traumatic or non-traumatic brain injury.

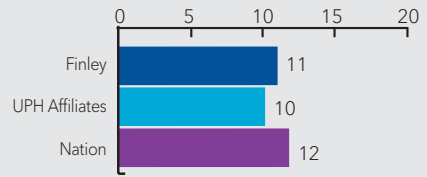

### Patients Served

Age	Patients
0-44	0
45-64	7
65-74	6
75+	10

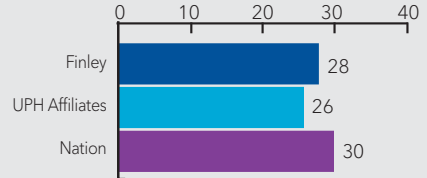

### Regaining Independence

A primary focus in acute rehabilitation is for patients to regain independence.

### Change in Self Care

### Change in Mobility

Quality Indicators measure a patient's functional abilities in areas of self care, such as eating, grooming, bathing, dressing, toileting and bowel/bladder management, as well as mobility. The Quality Indicators show how much a patient improved from admission to discharge. A higher Quality Indicator change reflects more progress that was made during their rehab stay.

# Returning Home

In 2020, 70 percent of our patients with brain injuries were discharged home after acute inpatient rehabilitation.

## Patients with Brain Injuries Returning Home in 2020

## Patient Experience

Based on data compiled from our 2020 patient experience surveys, 94% of the responders would recommend our UnityPoint Health - Finley Hospital Acute Rehab Unit to others.
